WORK EXPERIENCE

Dewar Insurance (A.W.G. Dewar, Inc.) | Boston, MA
Software Engineer — March 2026 - Present

- One of two full-time engineers replacing a legacy COBOL tuition insurance system with a new .NET, Angular, EF Core, and Azure platform; live in production ahead of office-wide rollout.
- Built student roster ingestion replacing manual processing of schools' Excel files: upload validation, exact and Levenshtein-based duplicate detection, a review UI for flagged records, and database-backed background jobs.
- Set up the team's testing and CI practice, including a GitHub Actions merge gate on line and branch coverage, raising coverage from near zero to 90%; added Azure Monitor alerts that notify Microsoft Teams on production failures.
- Built internal developer tools for team pain points, including coverage reports and migration conflict checks.
- Implemented optimistic concurrency so simultaneous edits to the same school or student record can't overwrite each other, and Azure SQL temporal tables to keep a change history for auditing.
- Proposed and helped implement Controller-Service-Repository layering, moving business logic and data access out of oversized controllers to make code easier to test and reuse; now the team standard.
- Building REST API integrations with a school information system and tuition vendor platforms (JWT authentication, retries, duplicate handling), working with business stakeholders to define data exchange requirements.
- Mentor interns through code review, task scoping, and an onboarding plan I wrote; their code now runs in production.

USAA | San Antonio, TX
Software Engineer II — November 2024 - March 2026

- Rebuilt Property & Claims intake flows (roadside assistance, glass replacement, auto claims) from a legacy Java, non-React UI into React front ends, implementing specs from business and design teams.
- Built Java Spring Boot REST APIs on AWS to replace legacy claim-processing services, including third-party API integrations with payload transformation and data synchronization.
- Built Datadog and Grafana dashboards, saved queries, and logging the team used to detect and diagnose outages, timeouts, and errors in claim services.

General Motors | Austin, TX
Cloud Platform Software Developer — March 2023 - June 2024
Backend Software Developer — January 2022 - March 2023

- Migrated dozens of Java microservices from legacy Java versions to modern Java on Azure App Service, and wrote migration playbooks and support runbooks for post-migration issues.
- Built GitLab CI pipelines and Backstage templates to standardize Azure microservice builds and deployments.

TECHNICAL SKILLS

- Languages: C#, Java, TypeScript, JavaScript, Python, SQL, Bash
- Frameworks: .NET / ASP.NET Core, Entity Framework Core, Angular, React, Spring Boot, Quarkus
- Data & Messaging: Azure SQL, PostgreSQL, Oracle, Redis, Kafka, Azure Service Bus, Azure Event Hubs
- Cloud & DevOps: Azure (App Service, Key Vault, Monitor, Blob Storage), AWS, Docker, Kubernetes, Helm, GitHub Actions, GitLab CI, Datadog, Grafana
- Testing: xUnit, JUnit, Mockito, Vitest, Playwright, Cypress, Postman, PIT (mutation testing), Coverlet
- Practices: REST APIs, JWT/OAuth, CI/CD, unit and integration testing, code review, Agile
- AI Tooling: GitHub Copilot, prompt engineering, custom agents and skills for development tasks

EDUCATION

Texas State University
Bachelor of Science in Computer Science | Minor in Mathematics — December 2021
